

Trail of f_1 in the 5-round attack, subrounds 19 and 20. Each panel is one subround of Forró: its five words enter at the top and leave at the bottom, and the boxes are the modular additions, XORs and rotations of the subround. The bracket under a word lists the active bits of its mask. *Red italic* bits are active in every kept trail, *green* bits are active only in some of them, and [] means that the word carries no active bit. A label t_j gives the mask of the intermediate value on branch j at the marked point. The enumeration starts from the target bit $v_{14}^{[18]}[27]$ at the top of subround 19 and follows the trails through the two subrounds. The masks at the bottom of subround 20 are on the last state $V^{[20]}$; the final key addition $\tilde{z}_j = v_j^{[20]} \boxplus k_j$ then turns them into masks on keystream bits and key bits.
